INTRODUCTION

THEORY BEHIND THE PROJECT:

- Software testing, an integral part of the development process for software
 applications that meet the highest standards of quality, can be a complex
 process, to say the least. With the increasing number of functionalities that
 applications today are bestowed with, not to mention the large number of
 platforms and browsers to account for, there is an ever-increasing possibility
 of bugs and issues going unnoticed. However, the highly competitive market
 scenario does not allow software developers the luxury of allowing products
 with even minor bugs to reach the market, as a product with issues will be
 outright rejected.
- In such a scenario, software developers have embraced automation testing to increase the efficiency of the testing process and to maximize test coverage. The best thing about automation is that it not just improves the quality of testing and makes it several times faster, but also reduces the cost involved.

AIM OF THE PROJECT:

• This project aims to do the overall Functional Testing on the website. It helps to improve the quality of the website and saves time from manually testing the website.

SOFTWARE REQUIREMENTS:

• Operating System: Windows 10

• Browser : Google Chrome (90.0.4430.212)

• Building Platform: Eclipse IDE

• Front-end : Language- Java

: Tool- Selenium WebDriver
